1 Heart Failure Prediction - Complete ML Analysis

1.1 Comprehensive Machine Learning Pipeline with Model Evaluation and Feature Analysis

1.1.1 Data Source & Citation

Dataset Name: Heart Failure Prediction Dataset

Source: Kaggle - **Link:** https://www.kaggle.com/datasets/fedesoriano/heart-failure-prediction - **Author:** fedesoriano - **License:** CC0: Public Domain

Alternative Sources: - UCI Machine Learning Repository: https://archive.ics.uci.edu/ - Original Cleveland Database

Citation:

```
Fedesoriano. (2021). Heart Failure Prediction Dataset. Retrieved from
https://www.kaggle.com/datasets/fedesoriano/heart-failure-prediction
```

Dataset Characteristics: - **Records:** 918 patient records - **Features:** 11 clinical measurements - **Target:** Heart disease presence (binary classification) - **Missing Values:** None - **Data Quality:** Clean and balanced dataset - **File Format:** CSV (heart.csv)

1.2 Section 1: Load & Explore Data

1.2.1 Feature Dictionary & Descriptions

Feature	Description
Age	Patient age in years
Sex	Gender (M=Male, F=Female)
ChestPainType	Type of chest pain experienced
RestingBP	Resting blood pressure (mmHg)
Cholesterol	Serum cholesterol level (mg/dL)
FastingBS	Fasting blood sugar > 120 mg/dL (0=No, 1=Yes)
RestingECG	Resting electrocardiogram results
MaxHR	Maximum heart rate achieved (bpm)
ExerciseAngina	Exercise-induced angina (0=No, 1=Yes)
Oldpeak	ST depression induced by exercise relative to rest
ST_Slope	Slope of the ST segment (Up/Flat/Down)
HeartDisease	Target: Heart disease presence (0=No, 1=Yes)

Dataset Overview: - **11 Input Features** + 1 Target Variable - **918 Total Samples** with balanced class distribution - **0 Missing Values** - Clean dataset - **Categorical Features**: Sex, ChestPainType, RestingECG, ExerciseAngina, ST_Slope, HeartDisease - **Numeric Features**: Age, RestingBP, Cholesterol, FastingBS, MaxHR, Oldpeak

```

```
Data preprocessing completed
Features: 11
Samples: 918
```

1.4 Section 3: Hyperparameter Tuning with GridSearchCV

Systematic hyperparameter optimization for all ML models using GridSearchCV. GridSearchCV internally uses **StratifiedKFold** (5-fold, stratified) to ensure robust parameter selection while preserving class distribution in each fold.

Why StratifiedKFold in GridSearchCV? - Ensures each CV fold has the same class ratio as the original dataset - Prevents imbalanced folds that could skew hyperparameter selection - Provides reliable ROC-AUC estimates for comparing parameter combinations - Maintains reproducibility with `random_state` parameter

GridSearchCV Workflow: 1. Define parameter grid for each model 2. For each parameter combination: Train on 4 folds, validate on 1 fold (5 iterations) 3. Calculate average CV score across 5 folds 4. Select parameters with highest average score 5. Evaluate final tuned model on test set

[11]:
```
# Define constants and setup for GridSearchCV
RANDOM_STATE = 42

# Create StratifiedKFold for use in GridSearchCV
cv = StratifiedKFold(n_splits=5, shuffle=True, random_state=RANDOM_STATE)

print('GridSearchCV Setup:')
print(f'  Random State: {RANDOM_STATE}')
print(f'  Cross-Validation: StratifiedKFold (n_splits=5, shuffle=True)')
print(f'  CV Folds preserve class distribution in each split')
```

```
GridSearchCV Setup:
  Random State: 42
  Cross-Validation: StratifiedKFold (n_splits=5, shuffle=True)
  CV Folds preserve class distribution in each split
```

[12]:
```
# Train-Test Split with Stratification
X_train, X_test, y_train, y_test = train_test_split(
    X, y,
    test_size=0.2,
    random_state=RANDOM_STATE,
```

```
    stratify=y
)

print('Train-Test Split (Stratified):')
print(f'  Train Set: {X_train.shape[0]} samples ({X_train.shape[0]/len(X)*100:.
 ↪1f}%)')
print(f'  Test Set:  {X_test.shape[0]} samples ({X_test.shape[0]/len(X)*100:.
 ↪1f}%)')
print(f'  Features: {X_train.shape[1]}')
print(f'  Train Class Distribution:')
print(f'    - No Disease: {(y_train == 0).sum()} ({(y_train == 0).sum()/
 ↪len(y_train)*100:.1f}%)')
print(f'    - Heart Failure: {(y_train == 1).sum()} ({(y_train == 1).sum()/
 ↪len(y_train)*100:.1f}%)')
```

```
Train-Test Split (Stratified):
  Train Set: 734 samples (80.0%)
  Test Set:  184 samples (20.0%)
  Features: 11
  Train Class Distribution:
    - No Disease: 328 (44.7%)
    - Heart Failure: 406 (55.3%)
```

```

1.5 Section 4: Model Evaluation - Confusion Matrix Analysis

Detailed evaluation of model predictions using confusion matrices to understand true positives, false positives, false negatives, and true negatives. This provides insights into model performance beyond aggregate metrics, especially important for understanding sensitivity (recall) and specificity.

[ ]:

```
```

```

Training ML Pipeline…

Pipeline Test Performance:
  Accuracy:  0.8641
  ROC-AUC:   0.9250
  Recall:    0.8824
  Precision: 0.8738
  F1-Score:  0.8780

Pipeline Structure:
Pipeline(steps=[('preprocessing',
                 ColumnTransformer(transformers=[('cat',
OrdinalEncoder(handle_unknown='use_encoded_value',
unknown_value=-1),
                                                 ['Sex', 'ChestPainType',
                                                  'RestingECG',
                                                  'ExerciseAngina',
                                                  'ST_Slope']),
                                                ('num', StandardScaler(),
                                                 ['Age', 'RestingBP',
                                                  'Cholesterol', 'FastingBS',
                                                  'MaxHR', 'Oldpeak'])])),
                ('model', RandomForestClassifier(n_jobs=-1, random_state=42))])

Pipeline Components:
  Preprocessing: ColumnTransformer with OrdinalEncoder + StandardScaler
  Model: RandomForestClassifier(n_estimators=100)

Pipeline Benefits:
  [OK] All preprocessing and modeling in one object
  [OK] Prevents data leakage
  [OK] Easy to deploy and reproduce
  [OK] Can be saved and loaded easily
  [OK] Works seamlessly with cross-validation and hyperparameter tuning
```
